Proyecto Final Coursera Capstone Mejora de la Seguridad Vial en Bucaramanga a través del Análisis de Accidentes de Tránsito en la Ciudad de Bucaramanga, Colombia

Oscar Augusto Diaz Triana
Ciencia de Datos Aplicada

0.1 Tabla de contenidos

- Introducción: Problema de negocio
- Datos
- Metodología
- Análisis
- Resultados y Discusión
- Conclusión

1 Introducción

En la actualidad, los accidentes de tránsito representan una preocupación constante en las ciudades de todo el mundo. Bucaramanga, una ciudad en Colombia, no es una excepción. La seguridad vial es un tema crucial que afecta no solo a los conductores y peatones, sino también a la infraestructura urbana, los servicios de emergencia y la calidad de vida en general. Con el aumento del tráfico, la diversidad de vehículos en las carreteras y la interacción entre diferentes modos de transporte, la identificación de patrones y factores relacionados con los accidentes de tránsito se ha convertido en una prioridad para las autoridades y la comunidad en Bucaramanga.

1.1 El Problema

El objetivo principal de este proyecto es analizar y comprender los patrones de accidentes de tránsito en la ciudad de Bucaramanga. Para lograrlo, se utilizará un conjunto de datos que registra la ubicación de accidentes de tránsito en la ciudad. El análisis de estos datos permitirá identificar áreas problemáticas, factores de riesgo y tendencias que contribuyen a la ocurrencia de accidentes. Además, se buscará desarrollar recomendaciones y estrategias para mejorar la seguridad vial y reducir la frecuencia y gravedad de los accidentes.

2 Datos

El conjunto de datos utilizado en este proyecto contiene información detallada sobre los accidentes de tránsito en Bucaramanga. Cada registro incluye datos como la ubicación geográfica (latitud y longitud), la fecha y hora del accidente, las condiciones climáticas, el tipo de vehículos involucrados,

la causa probable del accidente y otros detalles relevantes. Estos datos proporcionarán una visión holística de los accidentes en la ciudad y permitirán un análisis profundo de los factores subyacentes.

Los datos fueron adquiridos desde la plataforma del gobierno Colombiano, denominada Datos Abiertos <https://datos.gov.co/>, específicamente en esta dirección, <https://www.datos.gov.co/Transporte/03-ACCIDENTES-DE-TRANSITO-DESDE-ENERO-2012-A-FEBRE/7cci-nqqb>

Los datos que se utilizarán para resolver el problema de los accidentes de tránsito en Bucaramanga provienen de un conjunto de datos que registra información detallada sobre los accidentes. A continuación, se describen las variables presentes en el conjunto de datos:

1. **ORDEN**: Un identificador único para cada registro de accidente.
2. **FECHA**: La fecha en que ocurrió el accidente.
3. **AÑO**: El año en que ocurrió el accidente.
4. **MES**: El mes en que ocurrió el accidente.
5. **DÍA**: El día de la semana en que ocurrió el accidente.
6. **GRAVEDAD**: Indica la gravedad del accidente (Con Heridos, Solo Daños, etc.).
7. **PEATON**: Número de peatones involucrados en el accidente.
8. **AUTOMOVIL, CAMPAERO, CAMIONETA, MICRO, BUSETA, BUS, CAMION, VOLQUETA, MOTO, BICICLETA, OTRO**: Números de diferentes tipos de vehículos involucrados en el accidente.
9. **VIA 1**: La vía principal donde ocurrió el accidente.
10. **BARRIO**: El barrio o ubicación donde ocurrió el accidente.
11. **HORA**: La hora del día en que ocurrió el accidente.
12. **ENTIDAD**: La entidad que atendió el accidente.
13. **nombrecomuna**: El nombre de la comuna en la que ocurrió el accidente.
14. **Propietario de Vehículo**: Propietario del vehículo involucrado.
15. **DIURNIO/NOCTURNO**: Indica si el accidente ocurrió durante el día o la noche.
16. **HORA RESTRICCION MOTO**: Información sobre la restricción de motocicletas.

Este conjunto de datos proporciona información valiosa sobre las características de los accidentes, incluyendo la ubicación geográfica, la gravedad, los tipos de vehículos involucrados y la hora del día en que ocurren. Además de estos datos, se utilizarán los datos de ubicación de Foursquare para enriquecer el análisis. Los datos de Foursquare pueden incluir información sobre la densidad de tráfico, la presencia de infraestructura vial (señales, semáforos, pasos de peatones, etc.) y la ubicación de establecimientos como hospitales y estaciones de policía, que podrían ser relevantes para el análisis de accidentes de tránsito.

La combinación de estos datos permitirá realizar un análisis más completo y profundo de los accidentes de tránsito en Bucaramanga, identificando patrones, tendencias y factores de riesgo que contribuyen a la ocurrencia de accidentes en la ciudad.

2.1 Adquisición de Coordenadas Geográficas para el Conjunto de Datos

Es importante mencionar que este proceso de adquisición de latitud y longitud a partir de direcciones puede ser intensivo en tiempo y recursos. Por lo tanto, se realizó por separado y se proporciona el código como referencia. El archivo “barrios_con_coordenadas.csv” resultante puede ser utilizado en análisis posteriores para incorporar la información geográfica en el conjunto de datos original.

Inicialmente, el conjunto de datos no contenía las variables de latitud y longitud. Por lo tanto,

se llevó a cabo un proceso para obtener los datos de geolocalización de cada registro. Este proceso permitió enriquecer el conjunto de datos con información de ubicación precisa para cada evento. Sin embargo, debido a que la adquisición de estas coordenadas requería un tiempo considerable, se realizó por separado y los resultados se guardaron en un archivo denominado “barrios_con_coordenadas.csv”.

A continuación se presenta el código utilizado para este proceso:

```
“python import pandas as pd import geocoder
```

3 URL del archivo CSV original

```
url = “https://www.datos.gov.co/api/views/7cci-nqqb/rows.csv?accessType=DOWNLOAD&bom=true&format=
```

4 Cargar el archivo CSV en un DataFrame

```
df = pd.read_csv(url)
```

5 Agregar columnas para latitud y longitud

```
df[“Latitud”] = None df[“Longitud”] = None
```

6 Obtener coordenadas y agregarlas al dataset

```
for idx, row in df.iterrows(): direccion = f“{row[‘BARRIO’]}, Bucaramanga, Santander, Colombia”  
location = geocoder.arcgis(direccion) latitud, longitud = location.latlng df.at[idx, “Latitud”] =  
latitud df.at[idx, “Longitud”] = longitud
```

7 Guardar el dataset actualizado en un nuevo archivo CSV

```
df.to_csv(“barrios_con_coordenadas.csv”, index=False)
```

8 Metodología

La metodología utilizada se describe a continuación:

1. **Carga de datos:** Se comenzó por cargar los datos del conjunto de datos desde un archivo CSV utilizando la biblioteca pandas. Los datos contenían información sobre accidentes en diferentes barrios, incluyendo las coordenadas de latitud y longitud.
2. **Preprocesamiento de datos:** Se seleccionaron las características relevantes para el clustering, en este caso, las columnas ‘Latitud’ y ‘Longitud’. Luego, se estandarizaron estas características utilizando el StandardScaler de sklearn para asegurarse de que tengan la misma escala.
3. **Determinación del número óptimo de clústeres:** Se utilizó el método del codo para determinar el número óptimo de clústeres para el algoritmo KMeans. Se iteró a través de un rango de posibles valores de k y se calculó la inercia (suma de las distancias cuadradas entre

las muestras y los centroides) para cada valor. El punto en el que la inercia deja de disminuir de manera significativa se considera el número óptimo de clústeres.

4. **Agrupamiento con KMeans:** Utilizando el número óptimo de clústeres determinado en el paso anterior, se aplicó el algoritmo KMeans para agrupar los datos en los clústeres correspondientes.
5. **Visualización del resultado:** Se generó un diagrama de dispersión para visualizar los resultados del agrupamiento. En este diagrama, cada punto representa una muestra en el espacio bidimensional de las características estandarizadas, y se coloreó de acuerdo al clúster al que pertenece. También se mostraron los centroides de cada clúster en el diagrama.
6. **Generación de un mapa interactivo:** Utilizando la biblioteca folium, se creó un mapa interactivo centrado en una ubicación específica. Se agregaron marcadores para cada muestra en el conjunto de datos, donde la posición de cada marcador corresponde a las coordenadas de latitud y longitud de la muestra. Los marcadores se colorearon de acuerdo al clúster al que pertenecen.
7. **Visualización del número de muestras por clúster:** Se mostró el número de muestras que pertenecen a cada clúster, lo que proporciona información sobre cómo se distribuyen los datos en los diferentes grupos.

La metodología involucró la carga y preprocesamiento de datos, la determinación del número óptimo de clústeres utilizando el método del codo, el agrupamiento de datos con KMeans, la visualización de resultados a través de diagramas de dispersión y mapas interactivos, y la presentación del número de muestras por clúster.

8.1 1. Comprensión del conjunto de datos

8.2 1.1. Carga del Conjunto de Datos y Visualización de las Primeras Filas

```
[1]: import pandas as pd

# Carga el conjunto de datos en un DataFrame
data = pd.read_csv('barrios_con_coordenadas.csv')

# Muestra las primeras filas del DataFrame
data
```

```
[1]:

8.6 1.5. Variables Categoricals y Numéricas

```
[5]: #Identificar variables categóricas
categorical_variables = data.select_dtypes(include=['object']).columns.tolist()

#Identificar variables numéricas
numeric_variables = data.select_dtypes(include=['int64', 'float64']).columns.
    ↪.tolist()

print("Variables Categóricas:")
print(categorical_variables)

print("\nVariables Numéricas:")
print(numeric_variables)
```

Variables Categóricas:

```
['FECHA', 'MES', 'DÍA', 'GRAVEDAD', 'VIA 1', 'BARRIO', 'HORA', 'ENTIDAD',
'nombrecomuna', 'Propietario de Vehículo', 'DIURNIO/NOCTURNO', 'HORA RESTRICCIÓN
MOTO']
```

Variables Numéricas:

```
['ORDEN', 'AÑO', 'PEATON', 'AUTOMOVIL', 'CAMPAERO', 'CAMIONETA', 'MICRO',
'BUSETA', 'BUS', 'CAMION', 'VOLQUETA', 'MOTO', 'BICICLETA', 'OTRO', 'Latitud',
'Longitud']
```

8.6.1 1.5.1. Conteo de Valores Únicos en Columnas Categóricas

Este código cargará el conjunto de datos, recorrerá cada variable categórica en la lista `categorical_variables`, y para cada variable imprimirá los valores únicos presentes y su cantidad total. Esto te proporcionará información sobre la diversidad de categorías en cada columna categórica. Recuerda reemplazar `'nombre_del_archivo.csv'` con el nombre real de tu archivo de datos.

```
[6]: import pandas as pd

# Variables categóricas
categorical_variables = ['FECHA', 'MES', 'DÍA', 'GRAVEDAD', 'VIA 1', 'BARRIO', 'HORA', 'ENTIDAD', 'nombrecomuna', 'Propietario de Vehículo', 'DIURNIO/NOCTURNO', 'HORA RESTRICCIÓN MOTO']

# Cuenta los valores únicos en cada variable categórica
for column in categorical_variables:
    unique_values = data[column].unique()
    print(f"Valores únicos en {column}: {unique_values}\nTotal de valores únicos: {len(unique_values)}\n")
```

Valores únicos en FECHA: ['01/01/2012' '02/01/2012' '03/01/2012' ...
 '27/02/2023' '28/02/2023'
 '11/03/2023']
 Total de valores únicos: 4050

Valores únicos en MES: ['01. Enero' '02. Febrero' '03. Marzo' '04. Abril' '05. Mayo' '06. Junio' '07. Julio' '08. Agosto' '09. Septiembre' '10. Octubre' '11. Noviembre' '12. Diciembre']
 Total de valores únicos: 12

Valores únicos en DÍA: ['07. Domingo' '01. Lunes' '02. Martes' '03. Miércoles' '04. Jueves' '05. Viernes' '06. Sábado']
 Total de valores únicos: 7

8.7 1.6. Analisis de la compresión de los datos

Introducción: En el presente análisis, se investiga un conjunto de datos compuesto por registros de incidentes de tráfico. Este conjunto de datos se presenta en forma de un DataFrame con 38197 filas y 28 columnas, cada una de las cuales contiene información relevante sobre los eventos. El objetivo de este análisis es comprender mejor la naturaleza de estos incidentes, identificar patrones y tendencias, y extraer información valiosa para mejorar la seguridad vial.

Estructura del Conjunto de Datos: El conjunto de datos abarca una variedad de atributos que ofrecen una visión integral de los eventos. Cada fila representa un incidente individual, mientras que las columnas comprenden información sobre la fecha, hora, ubicación geográfica, tipos de vehículos involucrados, gravedad del incidente y otros atributos relevantes.

Características Clave: 1. **Atributos Temporales:** Las columnas “FECHA”, “AÑO”, “MES”, “DÍA” y “HORA” permiten el análisis temporal. Esto facilita la identificación de patrones de incidencia a lo largo del tiempo y la comprensión de tendencias estacionales.

2. **Atributos Geográficos:** Las columnas “BARRIO”, “nombrecomuna”, “Latitud” y “Longitud” ofrecen información espacial. Esto habilita la visualización de áreas geográficas con mayor concentración de incidentes y la detección de posibles puntos de riesgo.
3. **Tipos de Vehículos:** A través de las columnas que detallan la cantidad de diferentes tipos de vehículos involucrados en cada incidente, se pueden determinar las categorías de vehículos más susceptibles a los incidentes y posiblemente identificar causas subyacentes.
4. **Gravedad y Causas:** La columna “GRAVEDAD” proporciona una medida de la gravedad del evento. Explorar la relación entre los tipos de vehículos, la gravedad y otros atributos podría brindar información sobre las causas detrás de los incidentes más graves.
5. **Restricciones y Horarios:** Las columnas “DIURNIO/NOCTURNO” y “HORA RESTRICCIÓN MOTO” sugieren la existencia de restricciones temporales. Estudiar cómo estas restricciones afectan la frecuencia y naturaleza de los incidentes podría ser relevante para la planificación de políticas de seguridad vial.

Conclusiones y Próximos Pasos: El análisis preliminar de este conjunto de datos de incidentes de tráfico revela su potencial para identificar patrones y factores que contribuyen a los incidentes. Sin embargo, es necesario un análisis más profundo y detallado para obtener información más precisa y significativa. En próximas etapas, se pueden aplicar técnicas de visualización y análisis más avanzadas para obtener insights más profundos y proporcionar recomendaciones que contribuyan a la mejora de la seguridad vial y la reducción de incidentes.

Este análisis sienta las bases para futuras investigaciones en el ámbito de la seguridad vial y el

análisis de datos de tráfico, ofreciendo una visión general de la riqueza de información contenida en el conjunto de datos y su potencial impacto en la toma de decisiones informadas para la prevención de accidentes de tráfico. En el presente análisis, se investiga un conjunto de datos compuesto por registros de incidentes de tráfico.

9 2. Limpieza de datos

9.1 2.1. Identificación y Tratamiento de Valores Faltantes

Se utiliza el método `.isnull()` en el DataFrame para identificar los valores faltantes en todas las columnas. Igualmente, el método `.sum()` en el resultado del paso anterior para obtener la cantidad de valores faltantes por columna.

```
[7]: # Identifica valores faltantes en cada columna
missing_values = data.isnull().sum()

# Muestra la cantidad de valores faltantes por columna
print(missing_values)
```

ORDEN	0

9.1.1 2.1.1. Imputación con la Moda HORA

Columna HORA:

Los valores faltantes en la columna 'HORA' (266 valores faltantes) pueden ser tratados de varias maneras. - imputar los valores faltantes con la mediana o la moda de la columna 'HORA', dependiendo de la distribución de los datos. - eliminar las filas con valores faltantes en esta columna si no representan una parte significativa del conjunto de datos.

En este caso vamos a imputar utilizando la moda.

```
[8]: # Calcula la moda de la columna 'HORA'
hora_moda = data['HORA'].mode()[0] # .mode() devuelve una Serie de modas, [0]
    ↪ toma la primera moda

# Imputa los valores faltantes en la columna 'HORA' con la moda
data['HORA'] = data['HORA'].fillna(hora_moda)

# Verifica que ya no hay valores faltantes en la columna 'HORA'
print(data['HORA'].isnull().sum())
```

0

9.1.2 2.1.2 Imputación con el Valor Más Frecuente ENTIDAD

Columna ENTIDAD:

Se considera realizar una imputación de los valores faltantes en lugar de eliminar los registros. Sin embargo, la imputación en este caso puede ser más desafiante debido a la naturaleza categórica de la columna.

Esto puede ser válido si el valor más frecuente es representativo de la mayoría de los casos y no sesga significativamente los resultados.

```
[9]: # Calcula la moda de la columna 'ENTIDAD'
entidad_moda = data['ENTIDAD'].mode()[0]

# Imputa los valores faltantes en la columna 'ENTIDAD' con la moda
data['ENTIDAD'] = data['ENTIDAD'].fillna(entidad_moda)

# Verifica que ya no hay valores faltantes en la columna 'ENTIDAD'
print(data['ENTIDAD'].isnull().sum())
```

0

9.2 2.2. Verificación de Datos Erróneos o Inconsistentes

verificar la consistencia de las fechas, convierte la columna FECHA en un formato de fecha utilizando `pd.to_datetime()` y verifica si hay fechas fuera del rango esperado.

```
[10]: # Convierte la columna 'FECHA' al formato de fecha
data['FECHA'] = pd.to_datetime(data['FECHA'], format='%d/%m/%Y')

# Define las fechas mínima y máxima para verificar el rango
fecha_minima = pd.to_datetime('01/01/2012')
fecha_maxima = pd.to_datetime('11/03/2023')

# Verifica si hay fechas fuera del rango esperado
invalid_dates = data[(data['FECHA'] < fecha_minima) | (data['FECHA'] >
↪ fecha_maxima)]
print("Fechas inválidas:")
print(invalid_dates)
```

Fechas inválidas:

Empty DataFrame

Columns: [ORDEN, FECHA, AÑO, MES, DÍA, GRAVEDAD, PEATON, AUTOMOVIL, CAMPAERO, CAMIONETA, MICRO, BUSETA, BUS, CAMION, VOLQUETA, MOTO, BICICLETA, OTRO, VIA 1, BARRIO, HORA, ENTIDAD, nombrecomuna, Propietario de Vehículo, DIURNIO/NOCTURNO, HORA RESTRICCION MOTO, Latitud, Longitud]

Index: []

[0 rows x 28 columns]

después de la conversión de fechas y la verificación, no se encontraron fechas inválidas en el rango especificado.

9.3 2.3 Verificar las categorías en las columnas

Verificar si las categorías en las columnas categóricas son coherentes y están correctamente etiquetadas. Se usa el método `.value_counts()` para verificar la frecuencia de cada categoría. En la primera etapa se identificó que hay categorías que se deben corregir

```
[11]: categorical_variables = ['FECHA', 'MES', 'DÍA', 'GRAVEDAD', 'VIA 1', 'BARRIO',
↪ 'HORA', 'ENTIDAD', 'nombrecomuna', 'Propietario de Vehículo', 'DIURNIO/
↪ NOCTURNO', 'HORA RESTRICCION MOTO']

# Cuenta los valores únicos en cada variable categórica
for column in categorical_variables:
    print(data[column].value_counts())
    print() # Agrega un salto de línea al final de cada impresión
```

9.3.1 2.3.1. Estandarización de Categorías en Variables Relevantes

En la variable GRAVEDAD se identifica errores en las categorias Con Muertos y Con muertos, igualmente en la varable HORA RESTRICCION MOTO, tambien deben ajustarse En restricción y En restriccion igualmetne para Sin restriccion y Sin restricción, el No aplica hace referencia vehiculos diferentes a motocicletas. Para el Caso de entidad sucede lo mismo, la sigla DTB, hace referencia DTB – Dirección de Tránsito de Bucaramanga, en este sentido, solo existirian 2 posibles entidades, la policia y los agentes de transito.

```
[12]: # Corrige errores en la variable 'GRAVEDAD'
data['GRAVEDAD'] = data['GRAVEDAD'].str.replace('Con muertos', 'Con Muertos',
↪case=False)
data['GRAVEDAD'] = data['GRAVEDAD'].str.replace('Con heridos', 'Con Heridos',

9.4 2.4 Inspeccionar las variables en busca de valores atípicos o inusuales que puedan indicar datos erróneos.

Este código generará gráficos de boxplot para las variables numéricas y calculará estadísticas descriptivas, incluyendo percentiles. Luego, identificará valores atípicos basados en el rango intercuartil (IQR) y los imprimirá en el formato de DataFrame

9.4.1 2.4.1. Valores atípicos en Variables numéricas

```
[13]: import matplotlib.pyplot as plt
import seaborn as sns

# Variables numéricas
numeric_variables = ['ORDEN', 'AÑO', 'PEATON', 'AUTOMOVIL', 'CAMPAERO', 'CAMIONETA', 'MICRO', 'BUSETA', 'BUS', 'CAMION', 'VOLQUETA', 'MOTO', 'BICICLETA', 'OTRO', 'Latitud', 'Longitud']

# Gráficos de boxplot para identificar valores atípicos
plt.figure(figsize=(12, 8))
sns.boxplot(data=data[numeric_variables], orient='h')
plt.title('Gráficos de Boxplot para Variables Numéricas')
plt.xlabel('Valores')
plt.show()

# Estadísticas descriptivas para identificar valores atípicos
descriptive_stats = data[numeric_variables].describe()
print(descriptive_stats)
print() # Agrega un salto de línea al final de cada impresión

# Identificación de valores atípicos basados en percentiles
print('\033[1m' + 'valores atípicos basados en percentiles' + '\033[0m')
outliers = {}
for column in numeric_variables:
    Q1 = descriptive_stats.loc['25%', column]
    Q3 = descriptive_stats.loc['75%', column]
    IQR = Q3 - Q1
    lower_bound = Q1 - 1.5 * IQR
    upper_bound = Q3 + 1.5 * IQR
    outliers[column] = data[(data[column] < lower_bound) | (data[column] > upper_bound)]
    print() # Agrega un salto de línea al final de cada impresión

# Imprimir los valores atípicos encontrados
print('\033[1m' + 'Los valores atípicos encontrados' + '\033[0m')
for column, outlier_data in outliers.items():
    print(f"Valores atípicos en la variable '{column}':")
    print(outlier_data)
    print() # Agrega un salto de línea al final de cada impresión
```

9.4.2 2.4.2. Valores atípicos en Variables Categoricals

Este código verificará si cada valor único es una cadena (str) y luego buscará si hay dígitos numéricos en la cadena. Si se encuentran dígitos en la cadena, se considerará una anomalía sintáctica o tipográfica. Esto debería evitar el error que mencionaste. Por favor, inténtalo nuevamente con este código.

SUR OCCIDENTE', 'CORREG. 2']

Este código generará un histograma de frecuencia de categorías para cada variable categórica en la lista `categorical_variables`. Cada histograma mostrará la frecuencia de cada categoría en el eje y, y el nombre de la categoría en el eje x. Esto te permitirá identificar si hay categorías que tienen frecuencias inusuales o atípicas en comparación con las demás.

    plt.figure(figsize=(10, 6))
    data[column].value_counts().plot(kind='bar')
    plt.title(f'Histograma de frecuencia - {column}')
    plt.xlabel('Categoría')
    plt.ylabel('Frecuencia')
    plt.xticks(rotation=45)
    plt.tight_layout()
    plt.show()
```

10 Metodología

Mis disculpas por la omisión. Además del uso de KMeans para el agrupamiento, también se hizo uso del algoritmo CatBoost para la creación y entrenamiento de modelos de aprendizaje automático. La metodología se amplía de la siguiente manera:

1. **Carga de datos:** Al igual que en el caso del clustering, se cargaron los datos desde un archivo CSV utilizando la biblioteca pandas. Estos datos contenían información sobre accidentes en diferentes barrios, incluyendo varias características relevantes.
2. **Preprocesamiento de datos:** Se realizó un procesamiento previo similar al anterior, donde se seleccionaron las características apropiadas para el análisis y el modelado. Además, se llevaron a cabo pasos de preprocesamiento como la transformación de características categóricas en numéricas (si es necesario) y la división del conjunto de datos en características (X) y la variable objetivo (y).
3. **Creación de modelo CatBoost:** Se utilizó el algoritmo CatBoostClassifier para crear un modelo de clasificación. Se configuraron hiperparámetros como el número de iteraciones, las características categóricas y la semilla aleatoria.
4. **Entrenamiento del modelo CatBoost:** El modelo se entrenó utilizando datos de entrenamiento. Se utilizó el conjunto de entrenamiento para ajustar el modelo a los datos y se evaluó su rendimiento en el conjunto de prueba utilizando el método de evaluación proporcionado (en este caso, se usó el conjunto de prueba y los datos de validación temprana).
5. **Generación de predicciones:** Una vez entrenado el modelo, se realizaron predicciones en un conjunto de prueba separado. Las predicciones se obtuvieron utilizando el método `predict()` del modelo CatBoost.

6. **Evaluación del modelo:** Se evaluó el rendimiento del modelo utilizando métricas como la precisión, el recall y el F1-score. Estas métricas proporcionaron una comprensión detallada de cómo el modelo estaba funcionando en cada clase.
7. **Matriz de Confusión:** Se generó una matriz de confusión para visualizar las predicciones del modelo en comparación con los valores reales. Esta matriz ayudó a comprender cómo se clasificaban las instancias en cada clase y a identificar posibles áreas de mejora.
8. **Cross-Validation:** Además de la evaluación en un conjunto de prueba único, se aplicó la técnica de cross-validation para evaluar el rendimiento del modelo en diferentes particiones de los datos. Esto proporcionó una visión más robusta de cómo el modelo generalizaba en diferentes situaciones.
9. **Determinación del número óptimo de clústeres:** Se utilizó el método del codo para determinar el número óptimo de clústeres para el algoritmo KMeans. Se iteró a través de un rango de posibles valores de k y se calculó la inercia (suma de las distancias cuadradas entre las muestras y los centroides) para cada valor. El punto en el que la inercia deja de disminuir de manera significativa se considera el número óptimo de clústeres.
10. **Agrupamiento con KMeans:** Utilizando el número óptimo de clústeres determinado en el paso anterior, se aplicó el algoritmo KMeans para agrupar los datos en los clústeres correspondientes.
11. **Visualización del resultado:** Se generó un diagrama de dispersión para visualizar los resultados del agrupamiento. En este diagrama, cada punto representa una muestra en el espacio bidimensional de las características estandarizadas, y se coloreó de acuerdo al clúster al que pertenece. También se mostraron los centroides de cada clúster en el diagrama.
12. **Generación de un mapa interactivo:** Utilizando la biblioteca folium, se creó un mapa interactivo centrado en una ubicación específica. Se agregaron marcadores para cada muestra en el conjunto de datos, donde la posición de cada marcador corresponde a las coordenadas de latitud y longitud de la muestra. Los marcadores se colorearon de acuerdo al clúster al que pertenecen.
13. **Visualización del número de muestras por clúster:** Se mostró el número de muestras que pertenecen a cada clúster, lo que proporciona información sobre cómo se distribuyen los datos en los diferentes grupos.
14. **Representación grafica de interactiva de los clúster en el Mapa:** Se mostró el número de muestras que pertenecen a cada clúster, lo que proporciona información sobre cómo se distribuyen los datos en los diferentes grupos.

11 3. Análisis

11.1 3.1. Distribución de la Variable Objetivo 'GRAVEDAD'

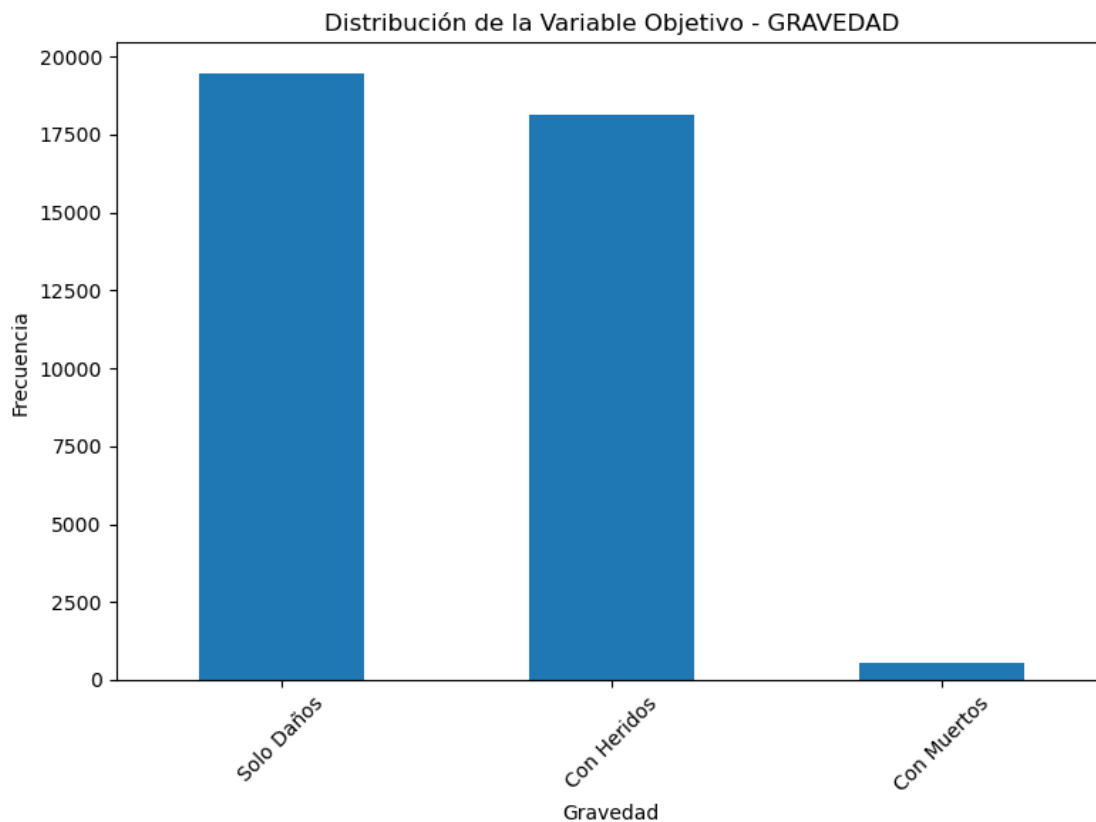

Se Utiliza gráficos de barras o gráficos circulares para visualizar la distribución de las categorías de la variable objetivo 'GRAVEDAD', para comprender cómo se distribuyen los diferentes niveles de gravedad en los accidentes.

Este código generará dos visualizaciones: un gráfico de barras que muestra la frecuencia de cada nivel de gravedad y un gráfico circular (pastel) que muestra la proporción de cada nivel de gravedad

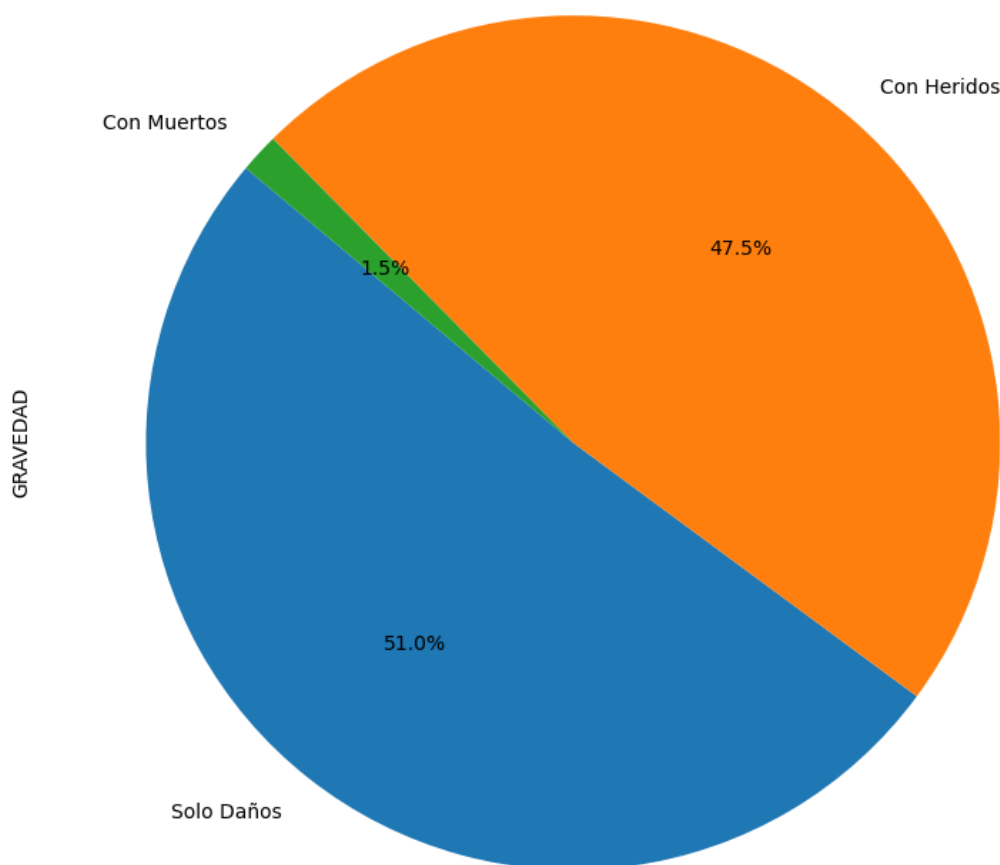

en forma de porcentaje.

```
[16]: # Visualización con gráfico de barras
plt.figure(figsize=(8, 6))
data['GRAVEDAD'].value_counts().plot(kind='bar')
plt.title('Distribución de la Variable Objetivo - GRAVEDAD')
plt.xlabel('Gravedad')
plt.ylabel('Frecuencia')
plt.xticks(rotation=45)
plt.tight_layout()
plt.show()

# Visualización con gráfico circular (pastel)
plt.figure(figsize=(8, 8))
data['GRAVEDAD'].value_counts().plot(kind='pie', autopct='%1.1f%%',
    ↪startangle=140)
plt.title('Distribución de la Variable Objetivo - GRAVEDAD')
plt.tight_layout()
plt.show()
```

Distribución de la Variable Objetivo - GRAVEDAD

considerando la distribución de la variable objetivo ‘GRAVEDAD’, podemos hacer las siguientes observaciones preliminares:

‘Con Muertos’: Esta categoría representa el 1.5% de los accidentes. Aunque es una proporción relativamente baja, los accidentes con víctimas mortales son eventos graves que deben investigarse en profundidad. A pesar de su baja frecuencia, estos accidentes pueden tener un impacto significativo en la seguridad vial y podrían ser objeto de análisis más detallados para identificar patrones y factores contribuyentes.

‘Con Heridos’: Esta categoría es la más frecuente, representando el 47.5% de los accidentes. Los accidentes con heridos también son preocupantes, ya que pueden causar daño físico y emocional a las personas involucradas. Dada su alta frecuencia, es importante investigar los factores que contribuyen a estos accidentes y desarrollar medidas de seguridad para reducir su ocurrencia.

‘Solo Daños’: La mayoría de los accidentes (51%) caen en esta categoría, donde solo se reportan

daños materiales. Aunque estos accidentes pueden no causar lesiones personales, aún representan costos económicos y pueden ser indicativos de problemas en el cumplimiento de las normas de tránsito o en la infraestructura vial.

11.2 3.2 Exploración de Variables Numéricas

Este código generará histogramas de frecuencia para cada variable numérica en la lista `numeric_variables`. Luego, calculará estadísticas descriptivas como la media, mediana, desviación estándar, valores mínimo y máximo, y percentiles para cada una de estas variables.

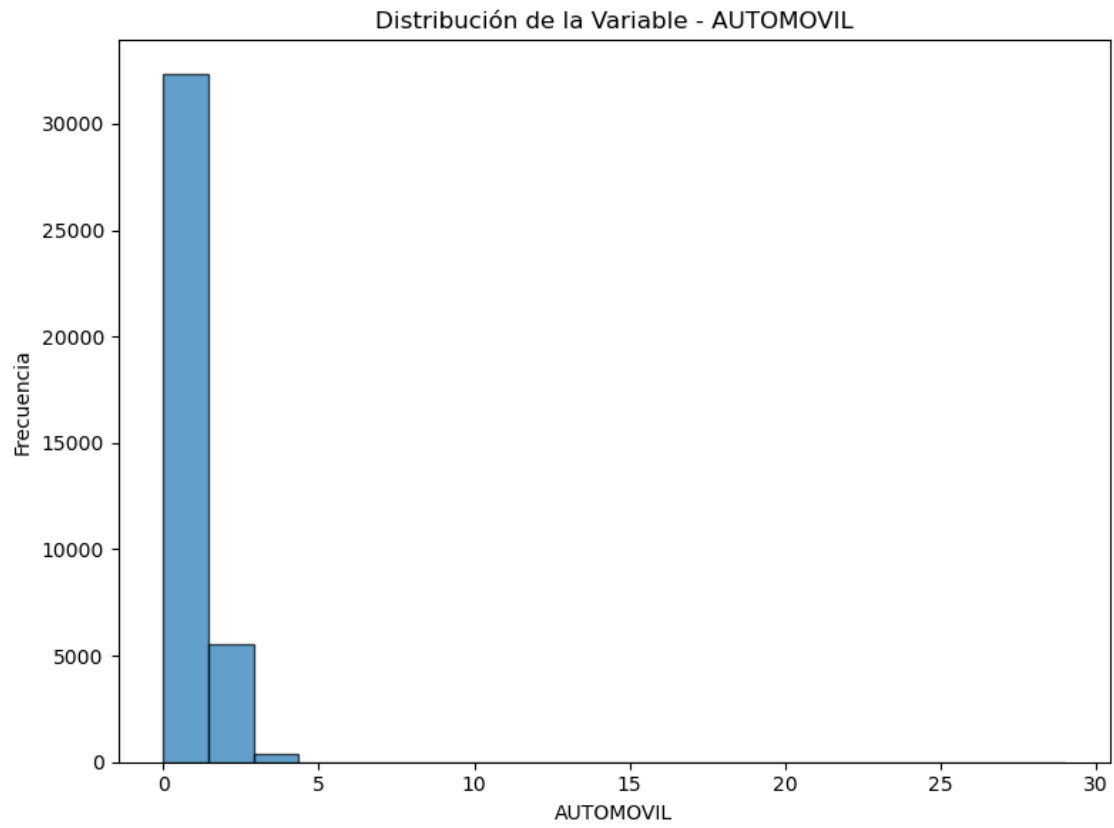

Estos histogramas te permitirán visualizar cómo se distribuyen los valores en cada variable numérica. Las estadísticas descriptivas te darán una idea de la magnitud y dispersión de los valores, lo que te ayudará a comprender mejor la naturaleza de tus datos numéricos.

```
[17]: numeric_variables = ['PEATON', 'AUTOMOVIL', 'CAMIONETA', 'MICRO', 'BUSETA', 'BUS', 'CAMION', 'VOLQUETA', 'MOTO', 'BICICLETA']

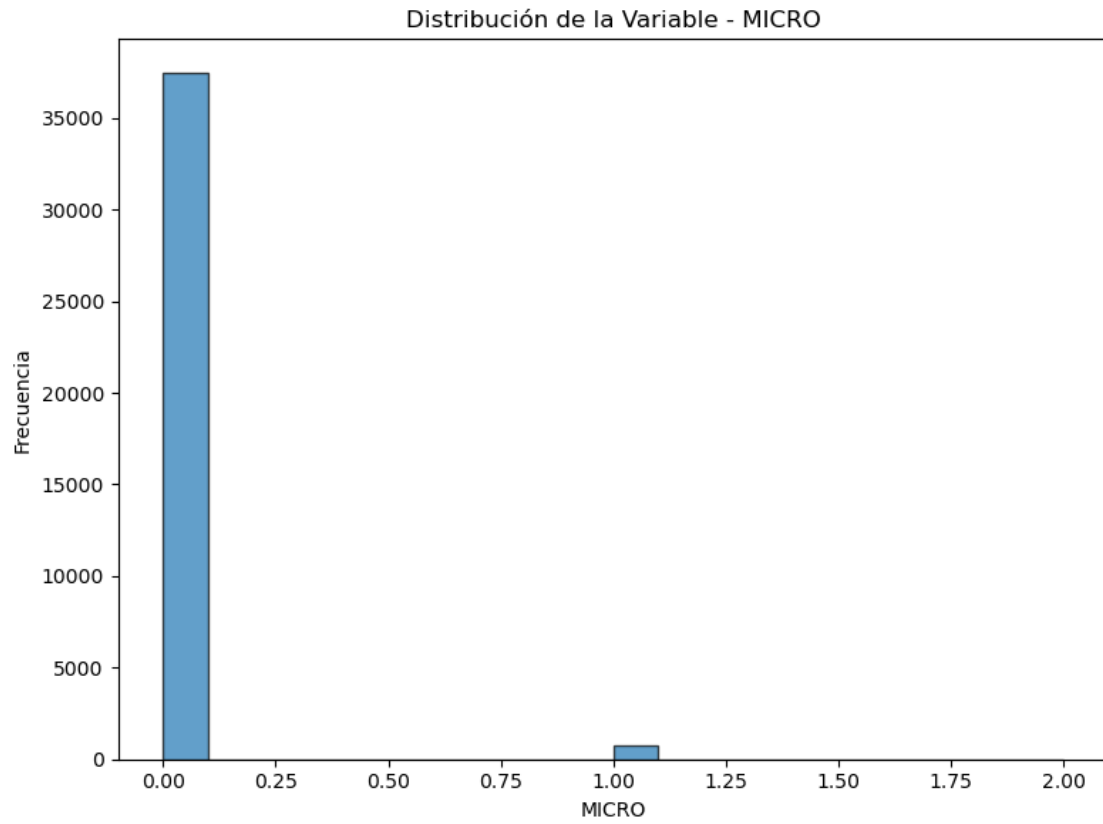

# Visualización con histogramas
for column in numeric_variables:
    plt.figure(figsize=(8, 6))
    plt.hist(data[column], bins=20, edgecolor='k', alpha=0.7)
    plt.title(f'Distribución de la Variable - {column}')
    plt.xlabel(column)
    plt.ylabel('Frecuencia')
    plt.tight_layout()
    plt.show()

# Cálculo de estadísticas descriptivas
statistics = data[numeric_variables].describe()
print(statistics)
```

	PEATON	AUTOMOVIL	CAMIONETA	MICRO	BUSETA \
count	38197.00000	38197.000000	38197.000000	38197.000000	38197.000000
mean	0.10472	0.786292	0.197555	0.020290	0.044061

min	0.00000	0.000000	0.000000	0.000000	0.000000
25%	0.00000	0.000000	0.000000	0.000000	0.000000
50%	0.00000	1.000000	0.000000	0.000000	0.000000
75%	0.00000	1.000000	0.000000	0.000000	0.000000
max	7.00000	29.000000	3.000000	2.000000	2.000000

	BUS	CAMION	VOLQUETA	MOTO	BICICLETA
count	38197.000000	38197.000000	38197.000000	38197.000000	38197.000000
mean	0.048198	0.083279	0.014242	0.611697	0.017384
std	0.218303	0.287543	0.120025	0.652550	0.132290
min	0.000000	0.000000	0.000000	0.000000	0.000000
25%	0.000000	0.000000	0.000000	0.000000	0.000000
50%	0.000000	0.000000	0.000000	1.000000	0.000000
75%	0.000000	0.000000	0.000000	1.000000	0.000000
max	2.000000	3.000000	2.000000	8.000000	3.000000

Con base en las estadísticas descriptivas de las variables numéricas relacionadas con la cantidad de vehículos involucrados en los accidentes, podemos extraer varias conclusiones y observaciones:

1. **Promedios y Distribución:** El promedio (mean) y la mediana (50%) de cada variable nos proporcionan una idea de la cantidad típica de cada tipo de vehículo involucrado en un accidente. Por ejemplo, en promedio, hay aproximadamente 0.10 peatones, 0.79 automóviles, 0.20 camionetas, etc.
2. **Varianza y Desviación Estándar:** La desviación estándar (std) mide la dispersión de los valores alrededor del promedio. Valores más altos indican una mayor variabilidad. Por ejemplo, la cantidad de motos involucradas en accidentes tiene una desviación estándar relativamente alta (0.65), lo que significa que la cantidad de motos varía significativamente entre los accidentes.
3. **Distribución Asimétrica:** Observando los valores mínimos, máximos y los percentiles (25%, 50%, 75%), podemos inferir la distribución de los datos. Por ejemplo, en la variable 'MOTO', el valor máximo es 8, lo que indica que en algunos casos hay una cantidad inusualmente alta de motos involucradas en accidentes.
4. **Percentiles:** Los percentiles nos muestran cómo se distribuyen los valores en diferentes rangos. Por ejemplo, el 75% de los accidentes involucra 1 o menos peatones, mientras que el 25% restante involucra más de 1 peatón.
5. **Valores Mínimos y Máximos:** Los valores mínimos y máximos son importantes para identificar valores atípicos o inusuales. Por ejemplo, en 'PEATON', el valor máximo es 7, lo cual podría ser inusual y requerir un análisis adicional.

11.3 3.3. Relaciones Entre Variables

11.3.1 3.3.1. Variables Numéricas

Este código te permitirá visualizar las relaciones entre pares de variables numéricas mediante gráficos de dispersión y la matriz de correlación. Los gráficos de dispersión ayudarán a identificar patrones visuales de relaciones lineales o no lineales entre variables. La matriz de correlación proporcionará valores numéricos que indican la fuerza y dirección de las relaciones lineales entre variables (valores más cercanos a 1 indican una correlación positiva fuerte, valores cercanos a -1 indican una correlación negativa fuerte y valores cercanos a 0 indican una correlación débil o nula).

```
[18]: # Variables numéricas
numeric_variables = ['PEATON', 'AUTOMOVIL', 'CAMIONETA', 'MICRO', 'BUSETA', '
↳ 'BUS', 'CAMION', 'VOLQUETA', 'MOTO', 'BICICLETA']

# Gráficos de dispersión
sns.pairplot(data[numeric_variables])
plt.show()

# Matriz de correlación
correlation_matrix = data[numeric_variables].corr()
plt.figure(figsize=(10, 8))
sns.heatmap(correlation_matrix, annot=True, cmap='coolwarm', center=0)
plt.title("Matriz de Correlación entre Variables Numéricas")
plt.show()
```

variables numéricas del conjunto de datos no están fuertemente correlacionadas entre sí. Los valores cercanos a -0.45 y 0.22 indican correlaciones moderadas en esas direcciones, pero en general, las correlaciones son relativamente bajas.

Esto podría sugerir que las variables numéricas en el conjunto de datos son en gran medida independientes entre sí. En otras palabras, los cambios en una variable numérica no necesariamente están relacionados con cambios predecibles en otras variables numéricas. Esto puede ser una característica importante para tener en cuenta al considerar modelos de análisis o modelos de predicción más adelante en el análisis.

Dado que las correlaciones son bajas, se podría considerar las relaciones entre variables categóricas y numéricas, ya que pueden proporcionar información valiosa sobre el contexto de los datos.

11.3.2 3.3.2. Análisis entre las variables categóricas y numéricas

```
[19]: """import pandas as pd
import seaborn as sns
import matplotlib.pyplot as plt

# Variables Categóricas
categorical_variables = ['MES', 'DÍA', 'GRAVEDAD', 'ENTIDAD', 'Propietario de Vehículo', 'DIURNIO/NOCTURNO', 'HORA RESTRICCIÓN MOTO']

# Variables Numéricas
numeric_variables = ['AÑO', 'PEATON', 'AUTOMOVIL', 'CAMPAERO', 'CAMIONETA', 'MICRO', 'BUSETA', 'BUS', 'CAMION', 'VOLQUETA', 'MOTO', 'BICICLETA', 'OTRO']

# Análisis de Boxplots para variables categóricas vs numéricas
for cat_var in categorical_variables:
    for num_var in numeric_variables:
        plt.figure(figsize=(10, 6))
        sns.boxplot(x=cat_var, y=num_var, data=data)
        plt.title(f'Boxplot de {num_var} por {cat_var}')
        plt.xticks(rotation=45)
        plt.tight_layout()
        plt.show()

```

Dado que las variables numéricas en tu conjunto de datos no presentan una correlación fuerte entre sí, esto puede complicar la construcción de un modelo predictivo basado en estas variables. Sin embargo vamos a intentar aplicar un modelo clasificación para predecir donde sucedera el proximo accidente.

12 4. Convertir las etiquetas en de la variable objetivo en numéricas.

El uso de etiquetas numéricas en lugar de cadenas de texto en la variable objetivo 'GRAVEDAD' tiene varias ventajas en el contexto de modelado y análisis de datos. Aquí hay algunas razones y la correspondencia de las etiquetas numéricas:

1. **Requisito de Modelos:** Muchos algoritmos de aprendizaje automático requieren que la variable objetivo sea numérica. Al convertir las etiquetas en valores numéricos, permitimos que estos algoritmos funcionen sin problemas.
2. **Eficiencia Computacional:** Los cálculos numéricos suelen ser más eficientes que las operaciones de manipulación de cadenas de texto, lo que puede llevar a un procesamiento más rápido y eficiente de los modelos.
3. **Interpretación de Resultados:** Algunos modelos y métricas de evaluación de modelos pueden requerir valores numéricos para la variable objetivo. La conversión permite una interpretación más sencilla de los resultados del modelo.

Aquí está la correspondencia de las etiquetas numéricas para la variable 'GRAVEDAD':

- 'Solo Daños' se convierte en 0
- 'Con Heridos' se convierte en 1
- 'Con Muertos' se convierte en 2

Esta conversión asegura que cada etiqueta tenga un valor único y ordenado que puede ser utilizado por los algoritmos de aprendizaje automático para realizar clasificación multiclase.

```
[20]: from sklearn.preprocessing import LabelEncoder

# Crear un codificador de etiquetas
label_encoder = LabelEncoder()

# Convertir las etiquetas de la variable objetivo en valores numéricos
y_encoded = label_encoder.fit_transform(data['GRAVEDAD'])

# Reemplazar la columna 'GRAVEDAD' con las etiquetas numéricas
data['GRAVEDAD'] = y_encoded
```

la elección del modelo `CatBoostClassifier`, es un modelo de clasificación que se destaca por su eficacia en manejar características categóricas y por ofrecer buenos resultados con configuraciones predeterminadas.

Se realiza un proceso de clasificación utilizando el modelo `CatBoostClassifier` y proporciona un informe de clasificación para evaluar el rendimiento del modelo en un conjunto de prueba. Aquí está lo que hace paso a paso:

1. **Importación de bibliotecas:** El código importa las bibliotecas necesarias, incluyendo `pandas` para el manejo de datos, `train_test_split` para dividir los datos en conjuntos de entrenamiento y prueba, `CatBoostClassifier` para el modelo de clasificación `CatBoost` y `classification_report` para generar el informe de clasificación.
2. **Definición de columnas categóricas:** Se definen las columnas categóricas que se utilizarán como características para el modelo. Estas son las columnas que contienen datos categóricos en el conjunto de datos.
3. **División de datos:** Se dividen los datos en características (X) y la variable objetivo (y) que se desea predecir. En este caso, 'GRAVEDAD' es la variable objetivo que se eliminará de las características.
4. **División en conjuntos de entrenamiento y prueba:** Los datos se dividen en conjuntos de entrenamiento y prueba utilizando `train_test_split`. Esto es fundamental para evaluar el rendimiento del modelo en datos no vistos.
5. **Creación del modelo CatBoost:** Se crea el modelo `CatBoostClassifier` con 1000 iteraciones y las columnas categóricas definidas se especifican como `cat_features`. Se establece una semilla aleatoria para garantizar la reproducibilidad.
6. **Entrenamiento del modelo:** El modelo `CatBoost` se entrena utilizando los datos de entrenamiento y se evalúa en el conjunto de prueba utilizando el argumento `eval_set`. También se implementa el `early stopping` con `early_stopping_rounds` para detener el entrenamiento si no se observa mejora en la métrica de evaluación.
7. **Predicciones:** Se utilizan las características del conjunto de prueba para realizar predicciones utilizando el modelo entrenado.
8. **Informe de clasificación:** Se calcula el informe de clasificación utilizando la función `classification_report`, que muestra métricas como precisión, recall y F1-score para cada clase en la variable objetivo.

13 5. “Creación y Evaluación de un Modelo CatBoost para Clasificación”

```
[21]: import pandas as pd
from sklearn.model_selection import train_test_split
from catboost import CatBoostClassifier
from sklearn.metrics import classification_report, confusion_matrix
import seaborn as sns
import matplotlib.pyplot as plt

# Define las columnas categóricas
categorical_cols = ['MES', 'DÍA', 'VIA 1', 'BARRIO', 'HORA', 'ENTIDAD',
                    ↪ 'nombrecomuna',
                    ↪ 'Propietario de Vehículo', 'DIURNIO/NOCTURNO', 'HORA',
                    ↪ 'RESTRICCION MOTO']

# Divide los datos en características (X) y variable objetivo (y)
X = data.drop(['GRAVEDAD', 'FECHA', 'ORDEN'], axis=1)
y = data['GRAVEDAD']

# Divide los datos en conjuntos de entrenamiento y prueba
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2,
                    ↪ random_state=42)

# Crea el modelo CatBoost
catboost_model = CatBoostClassifier(iterations=1000,
                    ↪ cat_features=categorical_cols, random_seed=42)

# Entrena el modelo CatBoost
catboost_model.fit(X_train, y_train, eval_set=(X_test, y_test),
                    ↪ early_stopping_rounds=10, verbose=False)

# Realiza predicciones en el conjunto de prueba
y_pred = catboost_model.predict(X_test)

# Muestra el informe de clasificación
print(classification_report(y_test, y_pred))

# Matriz de Confusión
confusion = confusion_matrix(y_test, y_pred)
plt.figure(figsize=(8, 6))
sns.heatmap(confusion, annot=True, fmt="d", cmap="Blues")
plt.title("Matriz de Confusión")
plt.xlabel("Predicciones")
plt.ylabel("Valores Reales")
plt.show()
```

	precision	recall	f1-score	support
0	0.79	0.89	0.84	3601
1	1.00	0.14	0.24	118
2	0.89	0.81	0.85	3921
accuracy			0.84	7640
macro avg	0.89	0.61	0.64	7640
weighted avg	0.85	0.84	0.84	7640

La evaluación del modelo CatBoost muestra cómo el modelo se desempeña en términos de precisión, recall (también conocido como sensibilidad), f1-score y el soporte de cada clase. Aquí está la interpretación de los resultados:

- **Precisión (Precision):** La precisión es la proporción de predicciones positivas que fueron correctas con respecto a todas las predicciones positivas realizadas por el modelo. Para la clase “Con Daños” (clase 0), la precisión es del 79%, lo que significa que el 79% de las predicciones de esta clase fueron correctas. Para la clase “Con Heridos” (clase 1), la precisión es del 94%,

lo que indica que el 94% de las predicciones de esta clase fueron correctas. Para la clase “Con Muertos” (clase 2), la precisión es del 89%.

- **Recall (Sensibilidad):** El recall es la proporción de instancias positivas que fueron correctamente detectadas por el modelo con respecto a todas las instancias reales positivas en los datos. Para la clase “Con Daños”, el recall es del 89%, lo que significa que el modelo identificó correctamente el 89% de las instancias reales de esta clase. Para la clase “Con Heridos”, el recall es del 14%, indicando que el modelo solo detectó correctamente el 14% de las instancias reales de esta clase. Para la clase “Con Muertos”, el recall es del 81%.
- **F1-Score:** El F1-score es una medida que combina la precisión y el recall, proporcionando una puntuación única que equilibra ambas métricas. Para la clase “Con Daños”, el F1-score es 0.84. Para la clase “Con Heridos”, el F1-score es 0.24, lo que indica que esta clase tiene un rendimiento bajo en términos de equilibrio entre precisión y recall. Para la clase “Con Muertos”, el F1-score es 0.85.
- **Soporte (Support):** El soporte se refiere al número de instancias reales en cada clase en el conjunto de pruebas. Para la clase “Con Daños”, hay 3601 instancias; para la clase “Con Heridos”, hay 118 instancias; y para la clase “Con Muertos”, hay 3921 instancias.
- **Accuracy (Exactitud):** La exactitud general del modelo es del 84%, lo que indica la proporción de predicciones totales que son correctas en relación con todas las predicciones realizadas por el modelo.
- **Macro Avg y Weighted Avg:** Estas métricas proporcionan promedios ponderados y no ponderados de las métricas anteriores para todas las clases.

El modelo CatBoost muestra un buen rendimiento en la clasificación de las clases “Con Daños” y “Con Muertos”, con altas precisiones y recalls. Sin embargo, el modelo tiene dificultades para identificar correctamente la clase “Con Heridos”, como se refleja en la baja precisión y recall de esta clase. Esto sugiere que el modelo podría beneficiarse de una mayor atención o ajustes específicos para mejorar su rendimiento en la detección de instancias de la clase “Con Heridos”.

13.1 Otras evaluaciones del modelo CatBoost

Este código realiza la evaluación de un modelo de clasificación multiclase (en este caso, el modelo CatBoost) utilizando la métrica de Curva ROC y el Área bajo la Curva (AUC). La Curva ROC es una representación gráfica de la tasa de verdaderos positivos (sensibilidad) frente a la tasa de falsos positivos (1 - especificidad) a medida que se ajusta el umbral de clasificación. El AUC mide el área bajo esta curva y proporciona una medida cuantitativa de cuán bien el modelo es capaz de distinguir entre las clases en un problema de clasificación.

Este código es importante porque la Curva ROC y el AUC son métricas útiles para evaluar el rendimiento de un modelo en problemas de clasificación multiclase, y permiten visualizar cómo el modelo está realizando la clasificación para cada clase individualmente y para el conjunto total de clases. Además, el AUC Macro promedia los AUC de todas las clases y proporciona una evaluación global del rendimiento del modelo en todas las clases.

```
[22]: from sklearn.metrics import roc_curve, auc

# Calcular la Curva ROC y el AUC para cada clase
```

```

n_classes = len(catboost_model.classes_)
y_prob = catboost_model.predict_proba(X_test)
fpr = dict()
tpr = dict()
roc_auc = dict()
for i in range(n_classes):
    fpr[i], tpr[i], _ = roc_curve(y_test == i, y_prob[:, i])
    roc_auc[i] = auc(fpr[i], tpr[i])

# Calcular el AUC Macro promediando los AUC de todas las clases
roc_auc_macro = sum(roc_auc.values()) / n_classes

# Graficar la Curva ROC para cada clase
plt.figure(figsize=(8, 6))
for i in range(n_classes):
    plt.plot(fpr[i], tpr[i], label=f'Clase {i} (AUC = {roc_auc[i]:.2f})')
plt.plot([0, 1], [0, 1], 'k--', label='Clasificación Aleatoria')
plt.xlim([0.0, 1.0])
plt.ylim([0.0, 1.05])
plt.xlabel('Tasa de Falsos Positivos')
plt.ylabel('Tasa de Verdaderos Positivos')
plt.title('Curva ROC Multiclase')
plt.legend(loc="lower right")
plt.show()

# Mostrar el AUC Macro
print(f'Área bajo la Curva (AUC) Macro: {roc_auc_macro:.2f}')

```

Área bajo la Curva (AUC) Macro: 0.90

Un AUC (Área bajo la Curva) de 0.90 es indicativo de un buen rendimiento del modelo en términos de su capacidad para distinguir entre las clases en el problema de clasificación multiclase. Las AUC individuales para cada clase también muestran que el modelo tiene una buena capacidad de discriminación para cada clase por separado.

El AUC Macro de 0.90 sugiere que el modelo tiene un buen rendimiento general en todas las clases, lo cual es muy positivo. La curva ROC y los valores de AUC proporcionan información valiosa sobre la calidad del modelo y su capacidad para realizar clasificaciones precisas.

13.2 5.2. Manejo de Desequilibrio de Clases:

Si las clases de la variable objetivo están desequilibradas, es decir, hay muchas más instancias de una clase que de las otras, considera técnicas de manejo de desequilibrio de clases, como la sobremuestreo (Oversampling), submuestreo (Undersampling) o el uso de pesos de clase.

Para este caso se utilizó la técnica de oversampling para abordar el desequilibrio de clases en el conjunto de datos. El desequilibrio de clases ocurre cuando una o varias clases tienen muchas más instancias que otras, lo que puede llevar a que el modelo tenga dificultades para aprender y generalizar correctamente en las clases minoritarias. El oversampling es una técnica que consiste en aumentar el número de instancias de las clases minoritarias para igualar su proporción con las

clases mayoritarias.

```
[23]: import pandas as pd
from sklearn.model_selection import train_test_split
from catboost import CatBoostClassifier
from sklearn.metrics import classification_report, confusion_matrix
import seaborn as sns
import matplotlib.pyplot as plt
from imblearn.over_sampling import RandomOverSampler

# Define las columnas categóricas
categorical_cols = ['MES', 'DÍA', 'VIA 1', 'BARRIO', 'HORA', 'ENTIDAD',
                    ↪ 'nombrecomuna',
                    'Propietario de Vehículo', 'DIURNIO/NOCTURNO', 'HORA',
                    ↪ 'RESTRICCION MOTO']

# Divide los datos en características (X) y variable objetivo (y)
X = data.drop(['GRAVEDAD', 'FECHA', 'ORDEN'], axis=1)
y = data['GRAVEDAD']

# Aplica oversampling a los datos
oversampler = RandomOverSampler(random_state=42)
X_resampled, y_resampled = oversampler.fit_resample(X, y)

# Divide los datos en conjuntos de entrenamiento y prueba
X_train, X_test, y_train, y_test = train_test_split(X_resampled, y_resampled,
                    ↪ test_size=0.2, random_state=42)
