13.2.10 Analisis de los rultados

Se evalua el rendimiento del modelo CatBoostClassifier en diferentes configuraciones utilizando la técnica de cross-validation. Las configuraciones varían en términos de iteraciones y grupos de cross-validation. Vamos a analizar los resultados:

1. Configuración: 500 iteraciones, 10 grupos de cross-validation
 - En todas las clases (0, 1, 2), el modelo muestra un buen rendimiento con alta precisión, recall y F1-score.
 - La precisión y recall son bastante altos, indicando que el modelo está identificando bien todas las clases.
 - El promedio ponderado y no ponderado de las métricas también es alto, lo que sugiere un buen rendimiento global en todos los datos.
 - La precisión general del modelo es del 92%, lo que es bastante sólido.
2. Configuración: 500 iteraciones, 15 grupos de cross-validation
 - Los resultados son muy similares a la configuración anterior de 10 grupos.
 - El rendimiento en todas las clases sigue siendo alto, y el promedio ponderado y no ponderado también son consistentes.
3. Configuración: 1000 iteraciones, 5 grupos de cross-validation

- Aunque la precisión y recall siguen siendo buenos en todas las clases, hay una pequeña disminución en el F1-score en comparación con las configuraciones anteriores.
 - El promedio ponderado y no ponderado de las métricas sigue siendo alto, pero ligeramente más bajo que en las configuraciones anteriores.
4. Configuración: 1000 iteraciones, 10 grupos de cross-validation
 - Similar a las configuraciones anteriores con 500 iteraciones, los resultados son muy buenos en términos de precisión, recall y F1-score en todas las clases.
 - El promedio ponderado y no ponderado de las métricas es ligeramente mejor que en la configuración con 5 grupos de cross-validation.
 5. Configuración: 1000 iteraciones, 15 grupos de cross-validation
 - Los resultados son prácticamente idénticos a la configuración con 10 grupos de cross-validation y 1000 iteraciones.
 - El rendimiento es consistente y muestra un alto nivel de precisión, recall y F1-score en todas las clases.
 6. Configuración: 1500 iteraciones, 5/10/15 grupos de cross-validation
 - Los resultados son consistentes con las configuraciones anteriores con 1000 iteraciones. No hay mejoras significativas en el rendimiento.

Parece que las configuraciones con 500 o 1000 iteraciones y 10 o 15 grupos de cross-validation brindan resultados sólidos y consistentes. Sin embargo, más iteraciones pueden llevar a un mayor tiempo de entrenamiento, por lo que es importante encontrar un equilibrio entre rendimiento y tiempo de entrenamiento según las necesidades y recursos disponibles.

Basándonos en los resultados y análisis, la combinación que generó los mejores resultados en términos de precisión, recall y F1-score parece ser:

Configuración: 500 iteraciones, 10 grupos de cross-validation

En esta configuración, el modelo alcanzó una precisión del 92% en todas las clases y mostró un alto nivel de recall y F1-score. Además, tanto el promedio ponderado como el no ponderado de las métricas fueron altos, lo que indica un buen rendimiento global en todos los datos.

Es importante mencionar que la diferencia entre esta configuración y otras con 500 o 1000 iteraciones y 10 o 15 grupos de cross-validation es relativamente pequeña. Sin embargo, esta configuración en particular parece ser la más equilibrada en términos de rendimiento y tiempo de entrenamiento.

13.3 5.5. Visualización de Importancia de Características

Después de ajustar el modelo, visualiza la importancia de las características para comprender cuáles están influyendo más en las predicciones del modelo. Esto te ayudará a interpretar las relaciones entre las características y la variable objetivo.

```
[51]: # Obtiene la importancia de características
feature_importance = catboost_model.
    ↪get_feature_importance(type='FeatureImportance')

# Crea un DataFrame para visualizar la importancia de características
importance_df = pd.DataFrame({'Feature': X.columns, 'Importance':
    ↪feature_importance})
importance_df = importance_df.sort_values(by='Importance', ascending=False)
```

```
# Visualiza la importancia de características
plt.figure(figsize=(10, 6))
plt.barh(importance_df['Feature'], importance_df['Importance'])
plt.xlabel('Importance')
plt.ylabel('Feature')
plt.title('Feature Importance')
plt.show()
```

14 6.Creación y Evaluación de un Modelo para agrupamiento K-Means

```
[68]: import pandas as pd
from sklearn.preprocessing import StandardScaler
from sklearn.cluster import KMeans
import matplotlib.pyplot as plt

# Carga el conjunto de datos
data = pd.read_csv('barrios_con_coordenadas_preprocesado.csv') # Cambia
↳ 'ruta_del_archivo.csv' por la ruta real de tu archivo

# Selecciona las características numéricas para el clustering
numeric_cols = ['Latitud', 'Longitud']
X = data[numeric_cols]

# Estandariza las características
```

```

scaler = StandardScaler()
X_scaled = scaler.fit_transform(X)

# Encuentra el número óptimo de clústeres usando el método del codo
inertia = []
for k in range(1, 11):
    kmeans = KMeans(n_clusters=k, random_state=42)
    kmeans.fit(X_scaled)
    inertia.append(kmeans.inertia_)

# Visualiza el método del codo
plt.figure(figsize=(8, 6))
plt.plot(range(1, 11), inertia, marker='o')
plt.title('Método del Codo')
plt.xlabel('Número de Clústeres')
plt.ylabel('Inercia')
plt.show()

# Encuentra el valor óptimo de k (número de clústeres)
optimal_k = None
min_diff = float('inf')
for k in range(1, len(inertia)):
    diff = inertia[k - 1] - inertia[k]
    if diff < min_diff:
        min_diff = diff
        optimal_k = k

print("Número óptimo de clústeres:", optimal_k)

```

```

15 7. Resultados y Discusión

En esta sección, se presentan los resultados obtenidos a lo largo de las iteraciones y las discusiones relevantes sobre los mismos. Se exploraron dos aspectos clave: el agrupamiento de barrios mediante el algoritmo KMeans y la creación y evaluación de modelos de clasificación utilizando CatBoost.

15.0.1 Agrupamiento de Barrios con KMeans

Después de realizar el análisis y aplicar el método del codo al conjunto de datos que contenía las coordenadas de los barrios, se determinó que el número óptimo de clústeres para el agrupamiento era 8. Este valor fue elegido basándonos en la disminución significativa en la inercia observada después de ese punto. Esto sugiere que el agrupamiento en 8 clústeres podría ser una forma efectiva de categorizar los barrios según su proximidad geográfica.

Al aplicar el algoritmo KMeans con 8 clústeres, se asignó cada barrio a un clúster específico. Esto permitió visualizar cómo los barrios se agrupan en función de sus ubicaciones geográficas. Además, el número de muestras en cada clúster se analizó para identificar la distribución de los barrios entre los diferentes grupos.

15.0.2 Modelado de Clasificación con CatBoost

Se utilizaron modelos de clasificación de CatBoost para predecir la gravedad de los accidentes en función de múltiples características. Se realizaron varias iteraciones ajustando los hiperparámetros, como el número de iteraciones y la cantidad de grupos en la validación cruzada. Se evaluó el rendimiento del modelo en términos de métricas de clasificación como precisión, recall y F1-score.

Las métricas de clasificación variaron según las iteraciones y la configuración de los hiperparámetros. Se observó que el rendimiento del modelo mejoró cuando se aumentó el número de iteraciones y se seleccionó una cantidad adecuada de grupos en la validación cruzada. Esto sugiere que un entrenamiento más prolongado y una validación más sólida pueden mejorar el rendimiento del modelo.

15.0.3 Comparación de Resultados

En general, los resultados indican que tanto el agrupamiento de barrios como la clasificación de la gravedad de los accidentes pueden proporcionar información valiosa para la toma de decisiones. El agrupamiento permite identificar patrones geográficos entre los barrios, mientras que el modelo de clasificación ayuda a prever la gravedad de los accidentes en función de características específicas. Sin embargo, es importante recordar que los resultados pueden depender de la calidad de los datos y de la elección adecuada de los hiperparámetros.

16 8. Conclusiones

En esta sección, se exploraron y discutieron los resultados obtenidos mediante el uso de técnicas de agrupamiento y modelos de clasificación. Se demostró cómo el análisis geográfico y el modelado predictivo pueden proporcionar información valiosa para la prevención y mitigación de accidentes de tráfico. Sin embargo, es fundamental tener en cuenta que cualquier análisis o modelo debe considerarse en el contexto de la calidad de los datos y las limitaciones del enfoque elegido.
